Options

☐ Lower case output

Convert all users and groups to lower case when passing the data to the application. This can be used to achieve case insensitivity for applications when the underlying directories contain mixed-cased data.

☐ Enable aliasing

With aliasing enabled, users can have a different username (alias) for the "crowd" application. This is useful if "crowd" does not support user renaming, but may impact the performance of incremental directory synchronization for this application. See the [documentation](#) for more information.

☒ Allow to generate user tokens

Allow this application to generate user tokens. For security reasons, it's recommended to disable this setting unless there are applications which require this setting to be enabled to work properly. To learn more, [see documentation](#)

☒ Authenticate with email address

Allow your users to authenticate with username or email address.

Add this user group to the "Crowd" application

The screenshot shows the 'Configure authentication' dialog box in the Atlassian Crowd interface. The dialog is titled 'Configure authentication' and contains the following sections:

- Directory mappings:** A text area explaining that Crowd checks for duplicate users and allows selecting default groups.
- Access-based synchronization:** A section with three radio button options:
 - ☒ All users and groups: Sync all users and groups, regardless of their access rights.
 - ☐ All groups, but only users with access rights: Sync all groups so users with access rights can keep all of their group memberships.
 - ☐ Only users and groups with access rights: Sync only users and groups that can access this application.
- Directory aggregation:** A section with a checkbox to determine users' group memberships using all directories.

The dialog also features a 'Groups that can authenticate' section with a search bar and a list of groups: 'crowd-users' and 'crowd-administrators'. The 'Save' button is highlighted in blue.

Add your IDP in the SAML configuration

The screenshot shows the 'SAML Configuration' page in the Atlassian Crowd interface. The page has a sidebar on the left with various navigation links, including 'General', 'Licensing', 'Find new apps', 'Manage apps', 'Application Links', 'Mail configuration', 'Mail template', 'Session configuration', 'Current sessions', 'Trusted proxy servers', 'System information', 'Clustering', 'Backup', 'Restore', 'Logging & profiling', 'LDAP connection pool', 'Look and feel', 'Analytics', 'Troubleshooting and support tools', 'SAML License', and 'SAML Configuration'.

The main content area is titled 'SAML Configuration' and includes tabs for 'Login', 'IDP', 'SP', 'SP XML', 'Authentication', 'HTTP Header Authentication', 'Authorization', and 'Help'. The 'IDP' tab is selected.

The 'Identity Provider XML Provider' section contains a dropdown menu for 'Url' and a text input field for 'Identity Provider XML' with the value 'https://keycloak.2improeit.dev/auth/realms/2improeit/protocol/saml/descriptor'. A 'Save' button is located at the bottom of the section.

Configure the SAML Authentication

- Add "crowd-users" to the "Default usergroup(s)"
- Enable "Create user"
